

### Data Wrangling with tidyr

Open RStudio and create a new project under your Module 5 folder and call it **Mod5Assignment1**. For this assignment, you will be creating an R Markdown document that will include topics previously covered as well as the use of tidyr to create tidy data that can be used to generate various visuals. Once completed, all you need to do is submit the word document that is created.

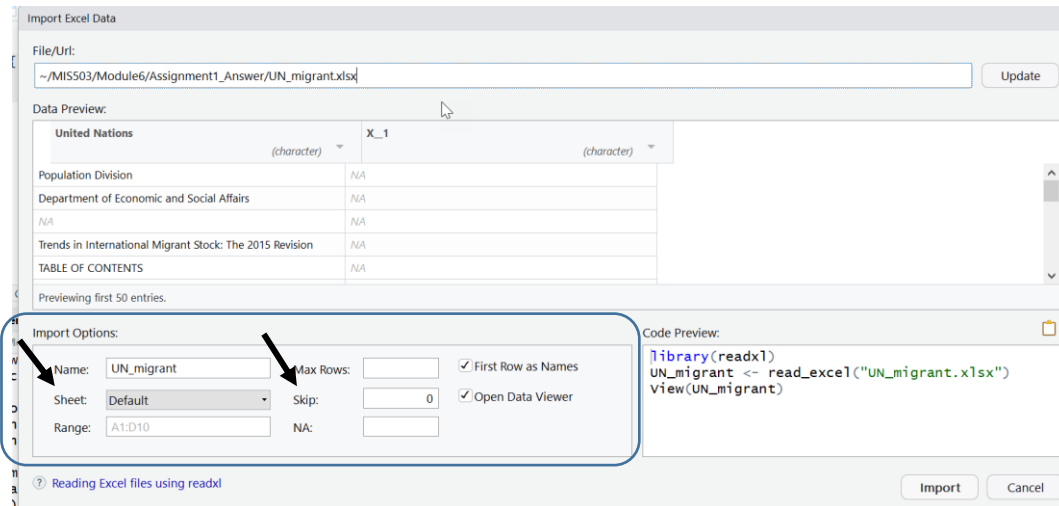

#### Create the R Markdown Document

- 1.) In RStudio, select *File -> New File -> Text File*. This will create a blank text file in the same area that scripts were created in previous assignments (upper left panel). Save this file to your project as **Mod5Assign1Answer.rmd** (it is important to save with the .rmd extension as this saves the text file as an R Markdown file).
- 2.) Create a Header 1 with the title: **Module 5 - Assignment 1**
- 3.) Create a Header 2 with the title: **Last Name, First Name** (replace with your name)
- 4.) Create a Header 3 with the title: **Data Wrangling**
- 5.) Click on the dropdown arrow next to the Knit icon  at the top of the R Markdown Pane in RStudio and select Knit to Word.
- 6.) Notice that you now have a document in your files for the project named **Mod5Assign1Answer.docx**. This is the file you will be uploading later to Canvas.
- 7.) For this assignment, you will need to download the **UN\_migrant.xlsx** file from Canvas. Save this in the same folder that you created the project in.

## Module 5: Assignment #1

### Part 1: Importing the dataset using readxl

- 8.) Within R Studio, click on the excel file you just added to the project folder and select Import Dataset...
- 9.) You may notice that this is different from the csv files we have been importing up to this point. Specifically, you should see something similar to the image below:

- 10.) Many times you will come across an Excel spreadsheet that may have multiple sheets of data. Import Options will allow you to choose which sheet you want to import. Select "Table 6" from the dropdown box next to "Sheet:" and notice that the preview changes to a set of data with countries listed and random numbers across the top (See image below).

...1 (character)	...2 (character)	...3 (character)	...4 (character)	United Nations (character)	...6 (character)	...7 (character)	...8 (character)	...9 (double)	...10 (double)
NA	NA	NA	NA	Population Division	NA	NA	NA	NA	NA
NA	NA	NA	NA	Department of Economic and Social Affairs	NA	NA	NA	NA	NA
NA	NA	NA	NA	Trends in International Migrant Stock: The 2015 Revision	NA	NA	NA	NA	NA
NA	NA	NA	NA	Table 6 - Estimated refugee stock at mid-year by major area...	NA	NA	NA	NA	NA
NA	NA	NA	NA	POP/DB/MIG/Stock/Rev2015	NA	NA	NA	NA	NA
NA	NA	NA	NA	December 2015 - Copyright © 2015 by United Nations. All r...	NA	NA	NA	NA	NA
NA	NA	NA	NA	Suggested citation: United Nations, Department of Economi...	NA	NA	NA	NA	NA
NA	NA	NA	NA	Country code	NA	NA	NA	NA	NA
Sort order	Major area, region, country or area of destination	Notes	Type of data (a)	Estimated refugee stock at mid-year (both sexes)	NA	NA	NA	NA	NA
1	WORLD	NA	900	1990	1995	2000	2005	2010	
2	Developed regions	(b)	901	18836571	17853840	15827803	13276733	15370755	
3	Developing regions	(c)	902	2014564	3609670	2997256	2361229	2048917	
				16822007	14244170	12830547	10915504	13323838	

- 11.) Notice that there is a number of rows that have blank data that we don't need. You can tell R which row to start working with by changing "Skip:" (see image after instruction 9). You will want to enter in 15 in the blank box next to "Skip:" to get the dataset we are working with for the assignment. Your preview should now look like the output below (not all columns are displayed in the image below):

...1 (double)	...2 (character)	...3 (character)	...4 (double)	...5 (character)	1990...6 (character)	1995...7 (character)	2000...8 (character)
1	WORLD	NA	900	NA	18836571	17853840	15827803
2	Developed regions	(b)	901	NA	2014564	3609670	2997256
3	Developing regions	(c)	902	NA	16822007	14244170	12830547

## Module 5: Assignment #1

12.) There are also some columns for the years (e.g., 1990...6) that are coming in as character. These should be changed to numeric. The columns from 1990...6 to 2015...11 should all be either numeric or double (if it is a double there is no need to change them). Make these changes.

Data Preview:

1990...6 (character)	1995...7 (character)	2000...8 (character)	2005...9 (character)	2010...10 (double)	2015...11 (double)
18836571	17853840	15827803	13276733	15370755	19577474
2014564	3609670	2997256	2361229	2046917	1954224
16822007	14244170	12830547	10915504	13323838	17623250
5048391	5160131	3047488	2363782	1957884	3443582
11773616	9084039	9783059	8551722	11365954	14179668

13.) Next, while still in the import screen, you will want to copy the code from the code preview to add to a new chunk of code in the R Markdown document. Since this is an Excel file, we will need to load the `readxl` package in addition to the `tidyverse`. So, copy both the library command and the import command that includes all of the changes you made above (you need to copy everything in the preview window except the `View(UN_migrant)` command).

14.) Create a new chunk of R code in your R Markdown document. Include the code to load the `tidyverse` package and then paste the code from the data import in the previous step after the `tidyverse` code.

### Part 2 – Cleaning Data with dplyr

15.) Now that we have imported the dataset, let's start to clean up the newly created tibble. Examining the tibble in the Global Environment panel, we can see that there are 265 observations and 22 variables. This is showing migration statistics across the world.

16.) Create a new Header 3 with the title: **Part 2 – Cleaning Data with dplyr**

17.) Create a new chunk of R code. We need to change some of the variable to represent the data correctly. Add the code to the new chunk to rename the following columns within the **UN\_migrant** in the tibble (remember you will have to start with `UN_migrant <-` so it will overwrite the column name in the tibble):

- Rename ...2 to Country
- Rename ...4 to Country\_Code
- Rename ...5 to Type
- Rename 1990...6 to 1990
- Rename 1995...7 to 1995
- Rename 2000...8 to 2000
- Rename 2005...9 to 2005
- Rename 2010...10 to 2010
- Rename 2015...11 to 2015

**Note:** To rename the year columns above, you will need to use quotes similar to the code:

```
UN_migrant <- rename(UN_migrant, "1990" = "1990...6")
```

## Module 5: Assignment #1

18.) Using dplyr, we want to create a new dataset that will only use some of the columns within the tibble. Write the code to create a new tibble called **Migration** that will include the following variables:

- Country
- Country\_Code
- Type
- "1990"
- "1995"
- "2000"
- "2005"
- "2010"
- "2015"

**NOTE:** to select the year columns above, you will need to include them in quotes when writing the code. If you don't, R will start looking for a numeric value in the function, not a column/variable.

19.) You should have a new tibble called Migration that has 265 observations and 9 variables.

### Part 3 – Creating tidy data using tidyr

20.) Now that we have the data imported and have the subset we want to work with, we need to check to make sure the data is tidy. Remember, to be tidy data each row must represent a different observation but right now, rows actually represent multiple observations across a number of years.

21.) Create a Header 3 with the title: **Part 3 – Creating tidy data using tidyr**

22.) Create a new chunk of R code. Using tidyr, use pivoting to create tidy data from the year columns. You will need to create a new tibble called **Migration2** and use pivoting to create a new column (or name) being year and the value being cases (see the online chapter on tidyr in R for Data Science as a reference, if needed). Include the head command in your code so you can view the first 6 rows. Once this has been done, your Migration2 tibble should look similar to the one below.

Country <chr>	Country_Code <dbl>	Type <chr>	year <chr>	cases <dbl>
WORLD	900	NA	1990	18836571
WORLD	900	NA	1995	17853840
WORLD	900	NA	2000	15827803
WORLD	900	NA	2005	13276733
WORLD	900	NA	2010	15370755

23.) Notice that we now have two columns (year and cases) but also take note that year is showing up as characters not numbers. Within the R Markdown document, write the code to change this variable from character to numeric (hint: this was done in one of the videos for this module).

### Part 4 – Visualizing your data

24.) From this data, we would like to know about migration in different regions and countries around the world.

25.) Create a Header 3 with the title: **Part 4 – Research Questions**

26.) Let's create 2 subsets of data to understand migration trends around the world. For these tibbles, you will be creating a subset of just a few variables. Here is an article that will help on filtering with multiple values (<https://blog.exploratory.io/filter-data-with-dplyr-76cf5f1a258e>). In a new chunk of code, create the two subsets below:

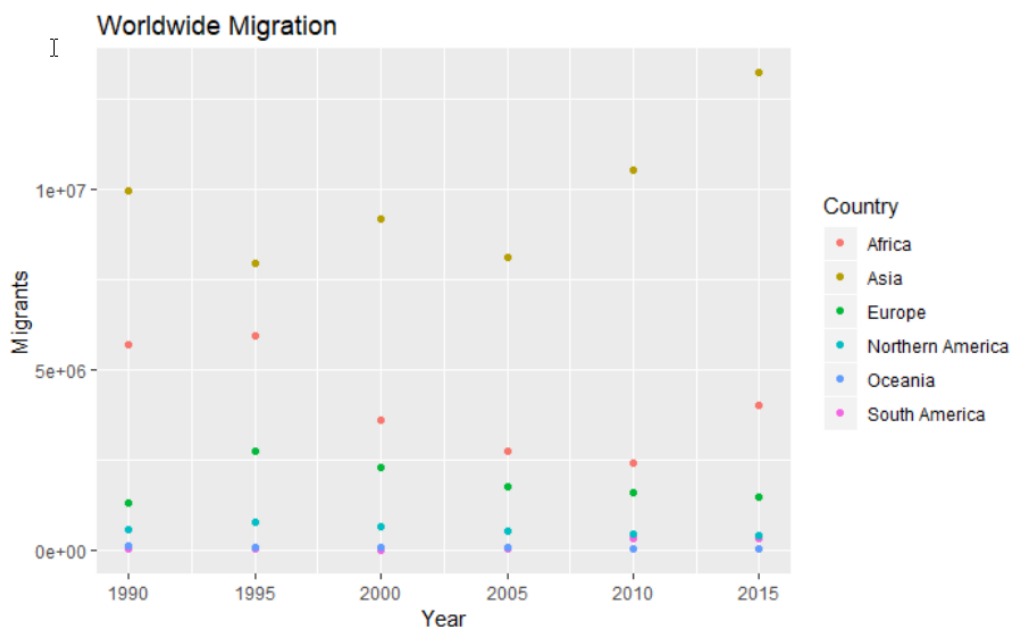

- RegionalMigration** – this subset should include all the variables from **Migration2** for the following regions in the Country column: Africa, Asia, Europe, Oceania, Northern America and South America.
- Americas** - this subset should include all the variables from **Migration2** for the following regions in the Country column: Central America, South America and Northern America

27.) Next, within your R Markdown document create a new Header 3 titled: **Worldwide Migration based on Regions** and write out the following questions in the document:

- Which region in the world had the highest number of migrants in the year 2005?
- Over the years, which region consistently has the most migrants every 5 year span? Which has the second most?
- What region has seen the fewest migrants over the years?
- Which plot was most useful in answering these questions and why?

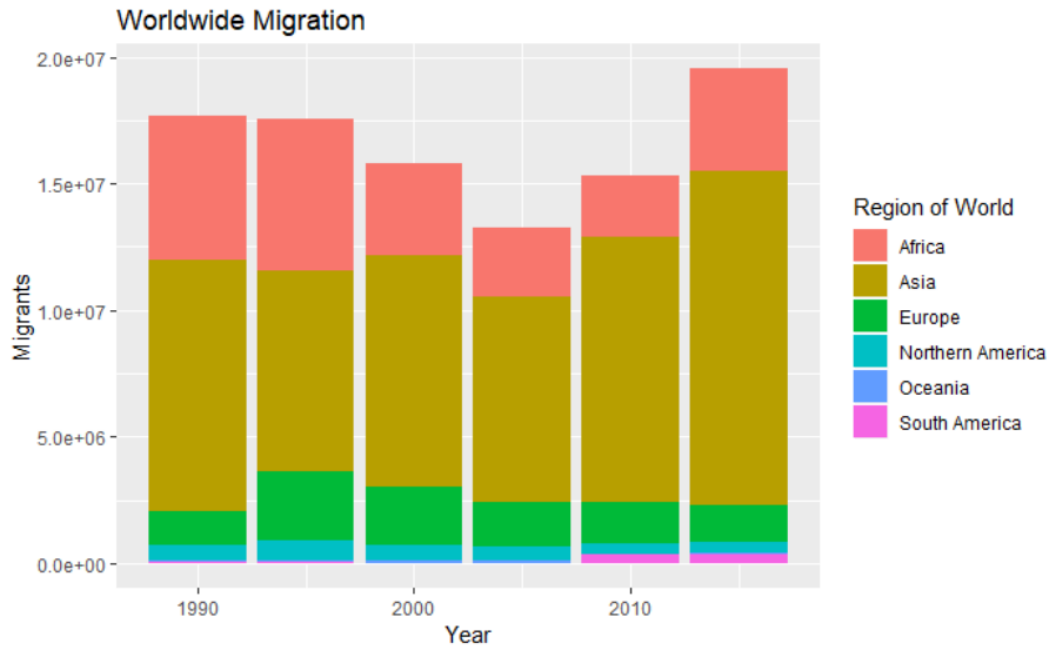

28.) To answer these questions, create the following two plots in your R Markdown document:

- A scatterplot with the year on the x-axis and cases on the y-axis with country being represented on the plot as a different color (also have the same labels/titles on your scatterplot as below):

## Module 5: Assignment #1

- b. Instead of using `geom_bar()`, you can create a bar graph of totals (this is because we already have all the cases totaled by region) using the `geom_col()`. The code is similar to the previous scatterplot but as you create your aesthetic statement, you will need to use “fill=” in place of “color=” to place the regions in color on the bar chart. You will also notice I change the title in the legend. This can be added to the original ggplot function statement by including `scale_fill_discrete(name=“Region of World”)`.

29.)Go back to the previous questions in the document (see step 27) and answer them based on the results from your graphs.

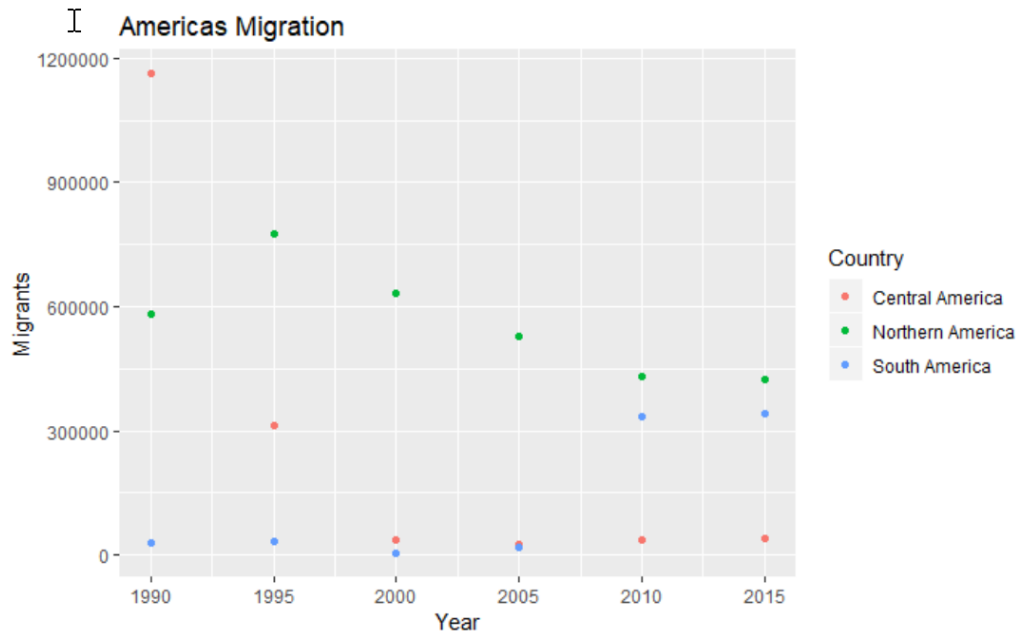

30.)Next, create a new Header 3 with the title: **Americas Migration by Region** and then add the following questions:

- In 1990, which region had the largest number of migrants for the Americas?
- Has this region continued to grow since 1990?
- What trends do you notice happening in the Americas over the years?
- Specifically, has Northern America increased or decreased over the years?
- Which plot was most useful in answering these questions and why?

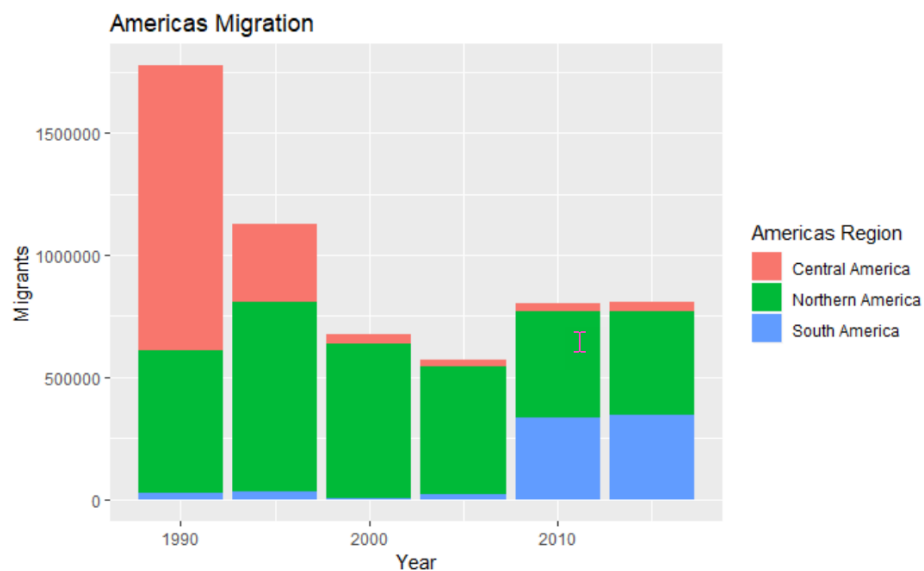

## Module 5: Assignment #1

31.)To answer these questions, create the following two plots in your R Markdown document:

- a. Scatterplot similar to the one below using similar syntax as before. Your plot should look like this:

- b. Create a bar graph with `geom_col()` using similar syntax as you used in the previous analysis. Your plot should look like this:

32.)Go back to the previous questions in the document (step 30) and answer them based on the results from your graphs.

33.)Finally, knit your R Markdown to Word and upload the document to Canvas
